ENSO QUICK LOOK September 19, 2007 A monthly summary of the status of El Niño, La Niña and the Southern Oscillation, or "ENSO"

Current equatorial sea surface temperatures (SSTs) are below average in most of the eastern tropical Pacific, particularly in the eastern one-third of the basin. If these conditions were to persist, they would be classified as La Niña. Based on the latest observations and forecasts, there is a 65 percent probability of maintaining La Niña conditions over the coming season.

Historically Speaking

El Niño and La Niña events tend to develop during the period Apr-Jun and they:

- Tend to reach their maximum strength during Dec-Feb
- Typically persist for 9-12 months, though occasionally persisting for up to 2 years
- Typically recur every 2 to 7 years

¹Probability of an El Niño refers to the likelihood of a sustained (that is, over several seasons) warming across a broad region of the eastern and central tropical Pacific, not just along coastal South America.

²Based on sea surface temperature departures from the long-term average over the "NINO3.4" region (120-170W, 5S-5N).
