

ENSO QUICK LOOK April 16, 2008 A monthly summary of the status of El Niño, La Niña and the Southern Oscillation, or "ENSO"

La Niña conditions have weakened in the equatorial Pacific. Below-average sea surface temperatures (SSTs) still exist across central equatorial Pacific, but they have been trending toward neutral since February 2008. There is a 60 percent probability of maintaining La Niña conditions over the coming season.

Current ENSO Forecast Summary¹

IRI Probabilistic ENSO Forecast²

Current Condition vs. Similar Conditions²

Historical Sea Surface Temperature Index²

Historically Speaking

El Niño and La Niña events tend to develop during the period Apr-Jun and they:

- Tend to reach their maximum strength during Dec-Feb
- Typically persist for 9-12 months, though occasionally persisting for up to 2 years
- Typically recur every 2 to 7 years

¹Probability of an El Niño refers to the likelihood of a sustained (that is, over several seasons) warming across a broad region of the eastern and central tropical Pacific, not just along coastal South America.

²Based on sea surface temperature departures from the long-term average over the "NINO3.4" region (120-170W, 5S-5N).
