ENSO QUICK LOOK September 19, 2013 A monthly summary of the status of El Niño, La Niña and the Southern Oscillation, or "ENSO", based on NINO3.4 index (120-170W, 5S-5N)

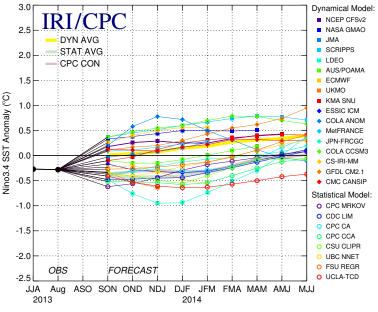

During August through early September the observed ENSO conditions remained neutral. Most of the ENSO prediction models indicate a continuation of neutral ENSO through 2013 and the first quarter of 2014. However, a few (mainly statistical) models call for cooling toward borderline or weak La Niña conditions for northern autumn into winter, while a few others (mainly dynamical) forecast a warming toward borderline or weak El Niño conditions for this same time frame.

Mid-Sep IRI/CPC Plume-Based Forecast²

Mid-Sep 2013 Plume of Model ENSO Predictions

Historically Speaking

El Niño and La Niña events tend to develop during the period Apr-Jun and they:

- Tend to reach their maximum strength during Dec-Feb
- Typically persist for 9-12 months, though occasionally persisting for up to 2 years
- Typically recur every 2 to 7 years

¹Based on a consensus of CPC and IRI forecasters, in association with the official CPC/IRI ENSO Diagnostic Discussion. ²Purely objective, based on regression, using equally weighted model predictions from the plume.
