Global contexts – livestock domains

Feeding the world

(2.5 billion more to feed by 2050)

Climate change
(temperatures to rise by 1-3.5°C by 2100)

Land use change
Urbanization/irrigation

Biodiversity change

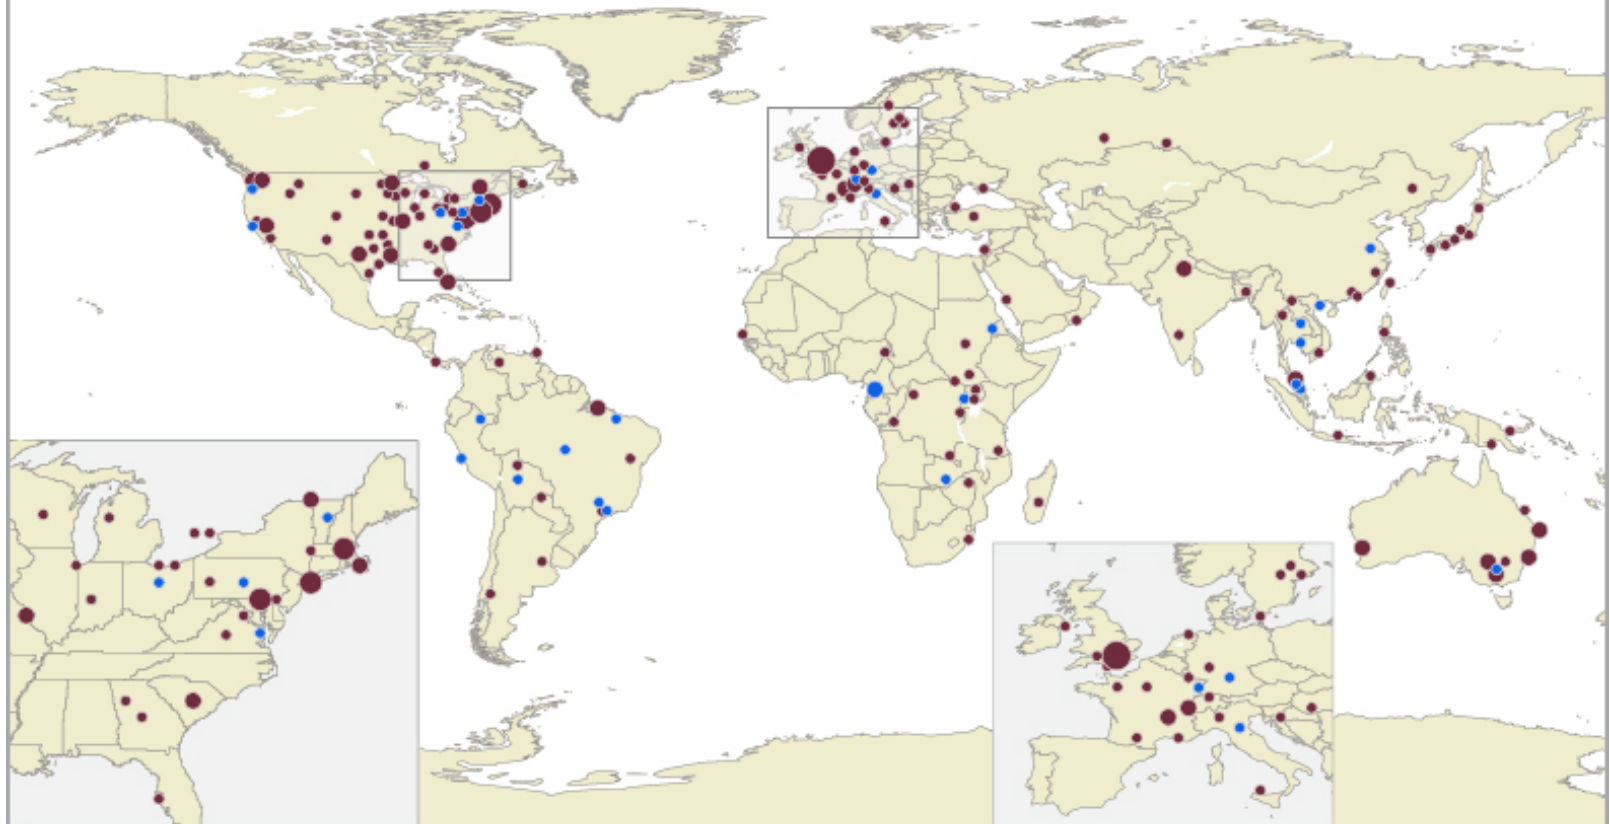

Environmental degradation

Emerging Zoonotic Disease Events, 1940-2012

Potential Hotspots in US, Western Europe, Brazil, Southeast Asia

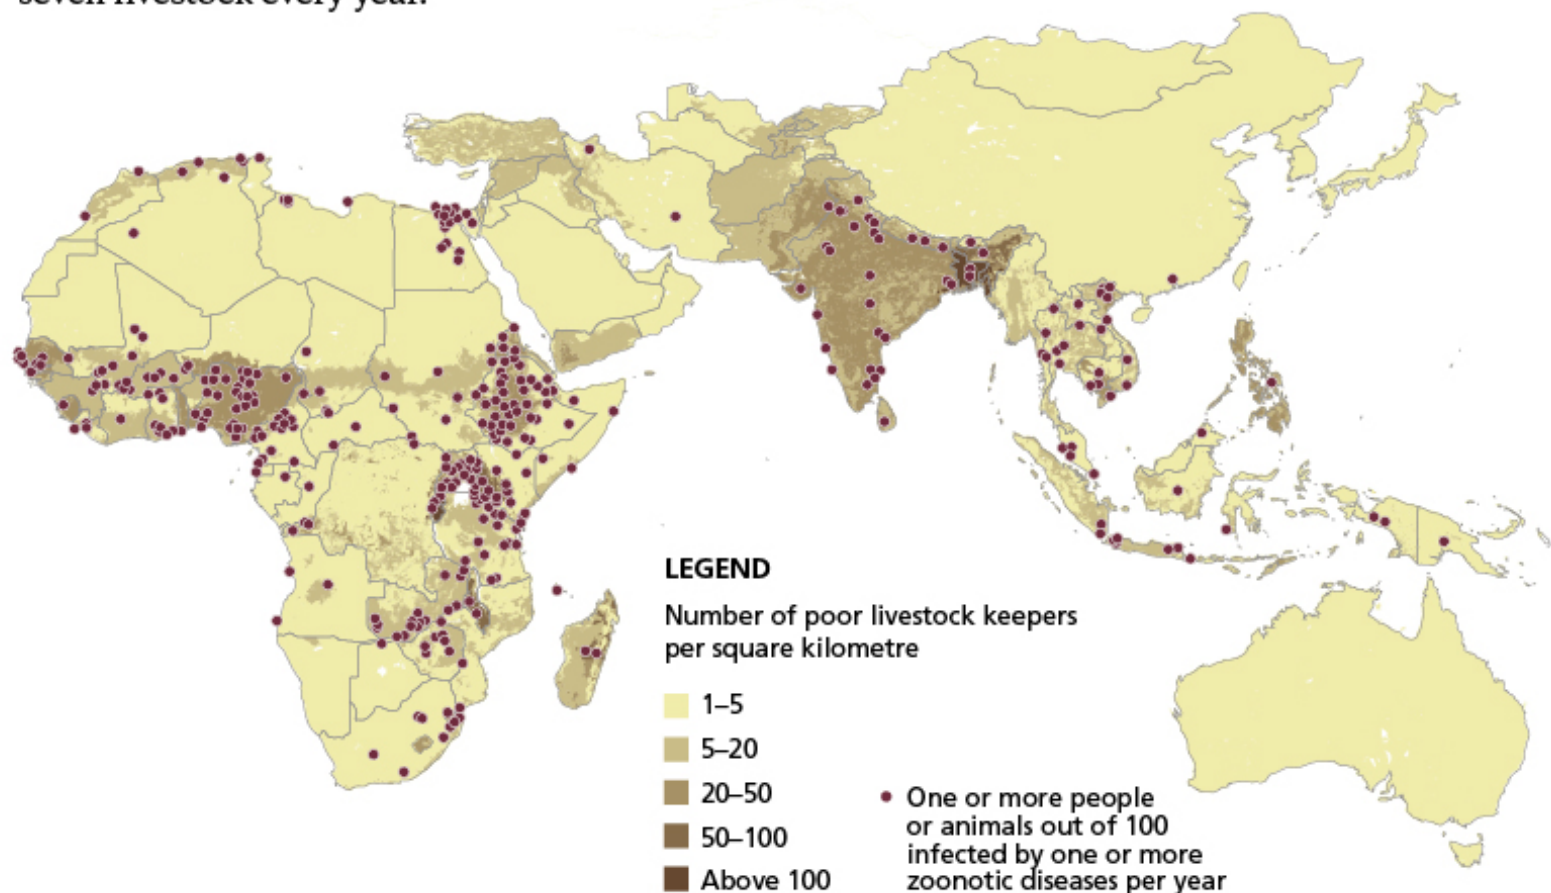

Most emerging human diseases come from animals. This map locates zoonotic events over the past 72 years, with recent events (identified by an ILRI-led study in 2012) in blue. Like earlier analyses, the study shows western Europe and western USA are hotspots; recent events, however, show an increasingly higher representation of developing countries.

- 1 EVENT
- 2-3 EVENTS
- 4-5 EVENTS
- 6 EVENTS
- EVENTS IDENTIFIED IN 2012 (recent emergence)

Greatest Burden of Zoonoses Falls on One Billion Poor Livestock Keepers

An ILRI study shows that zoonotic diseases are major obstacles in pathways out of poverty for one billion poor livestock keepers. The diseases mapped cause 2.3 billion human illnesses and 1.7 million human deaths a year. In poor countries, the diseases also infect more than one in seven livestock every year.

Climate sensitive zoonoses & poverty

Malaria in Finland

One health for forecastable disease

One Health

Animal/Plant – Human – Environmental Health

Focus hazards and risks

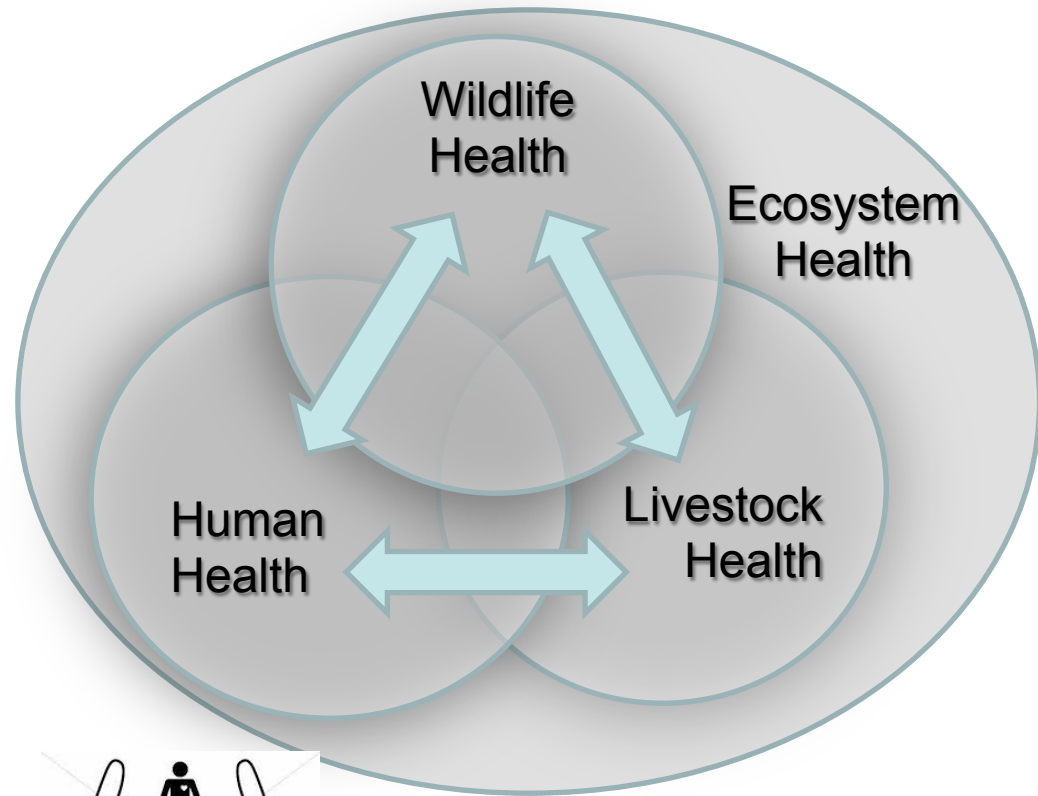

- Zoonoses and FBD

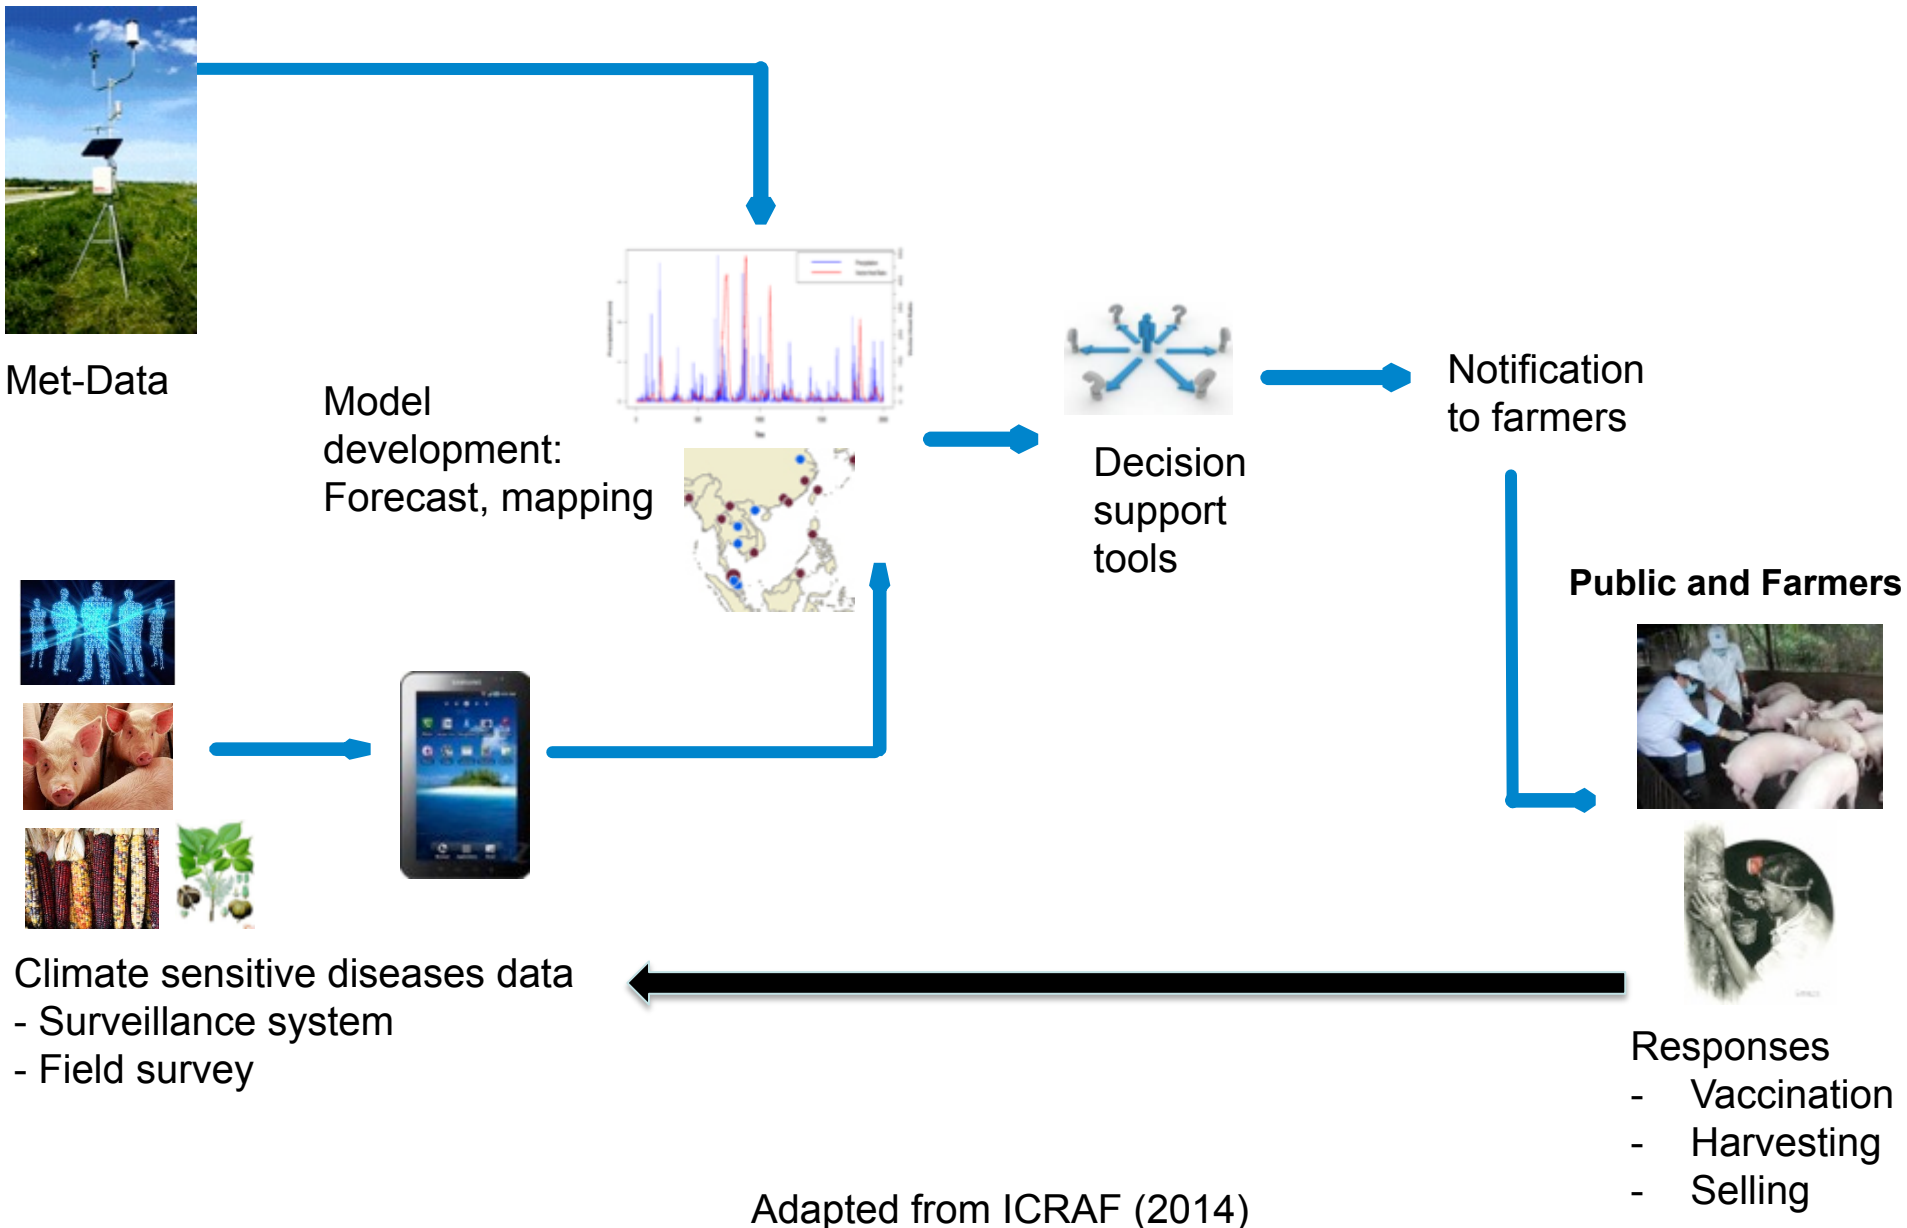

- Aflatoxin in maize

- Rubber leaf disease

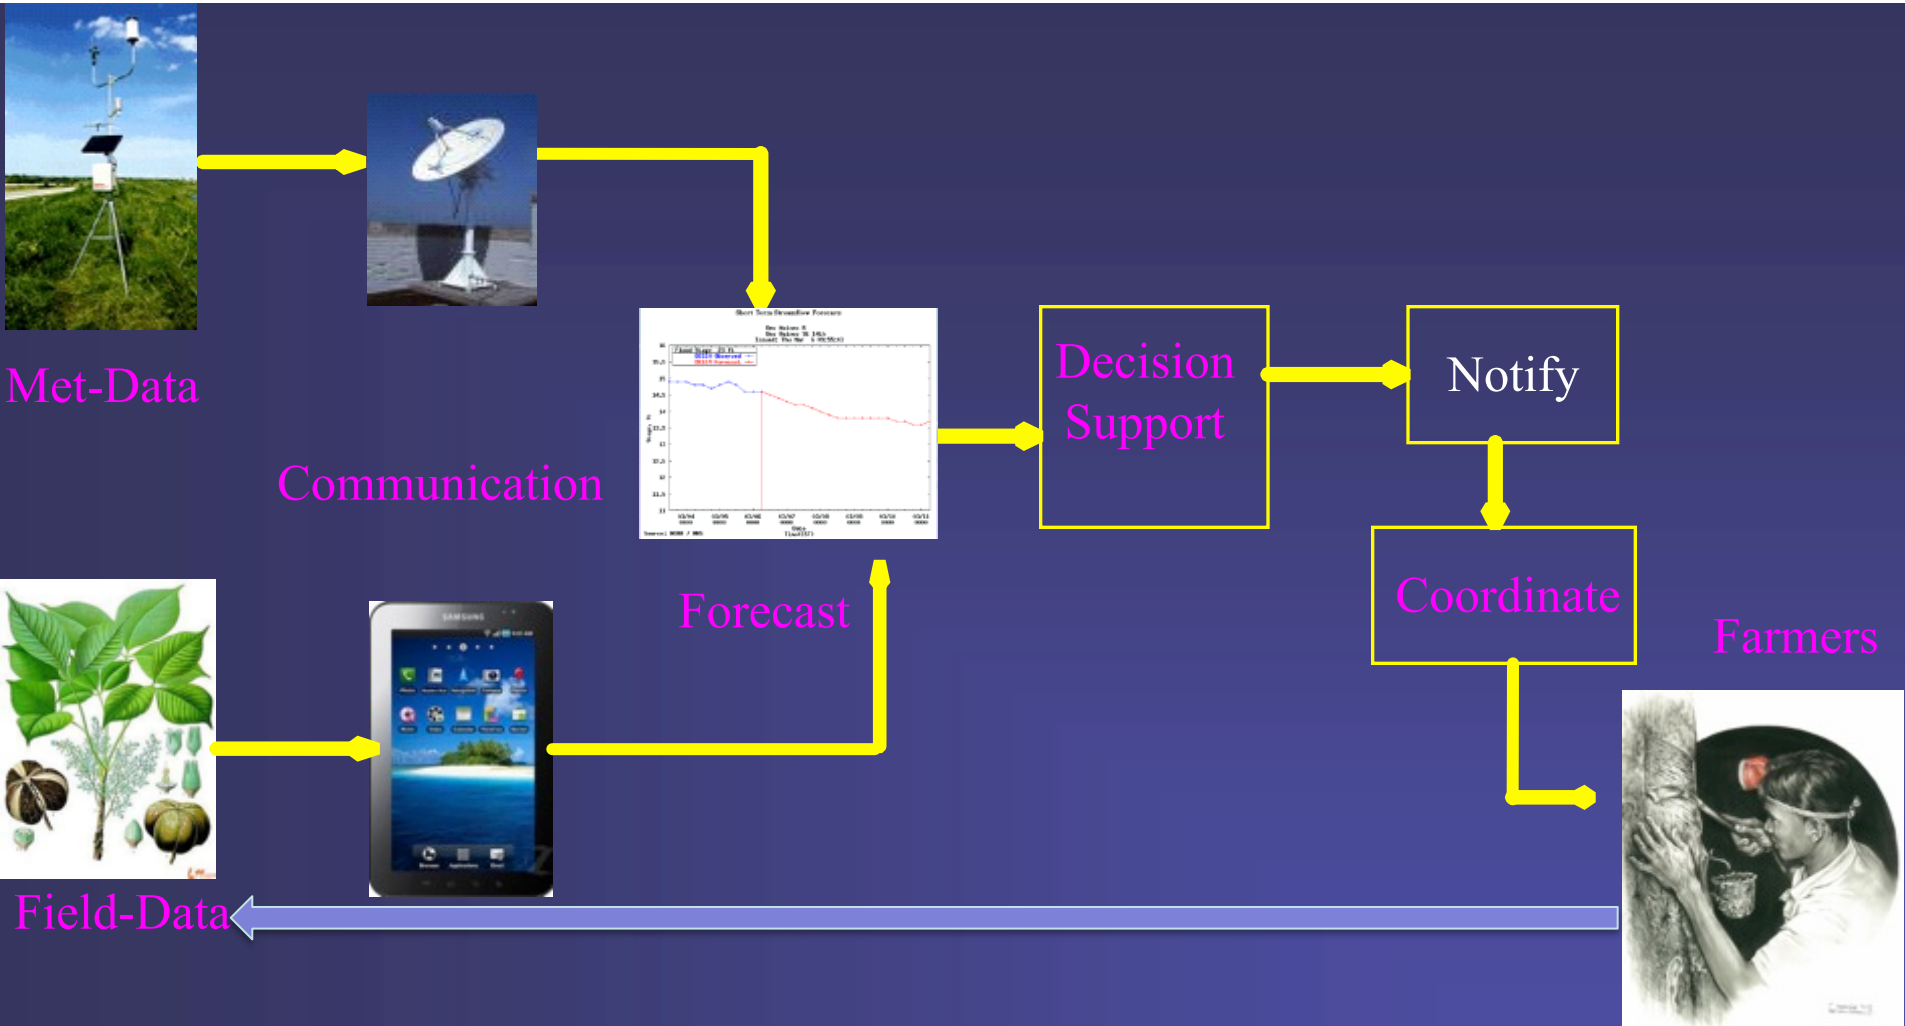

Early Warning and Forecasting System concept

Adapted from ICRAF (2014)

End-to-End Early Warning and Forecasting System for Rubber fall

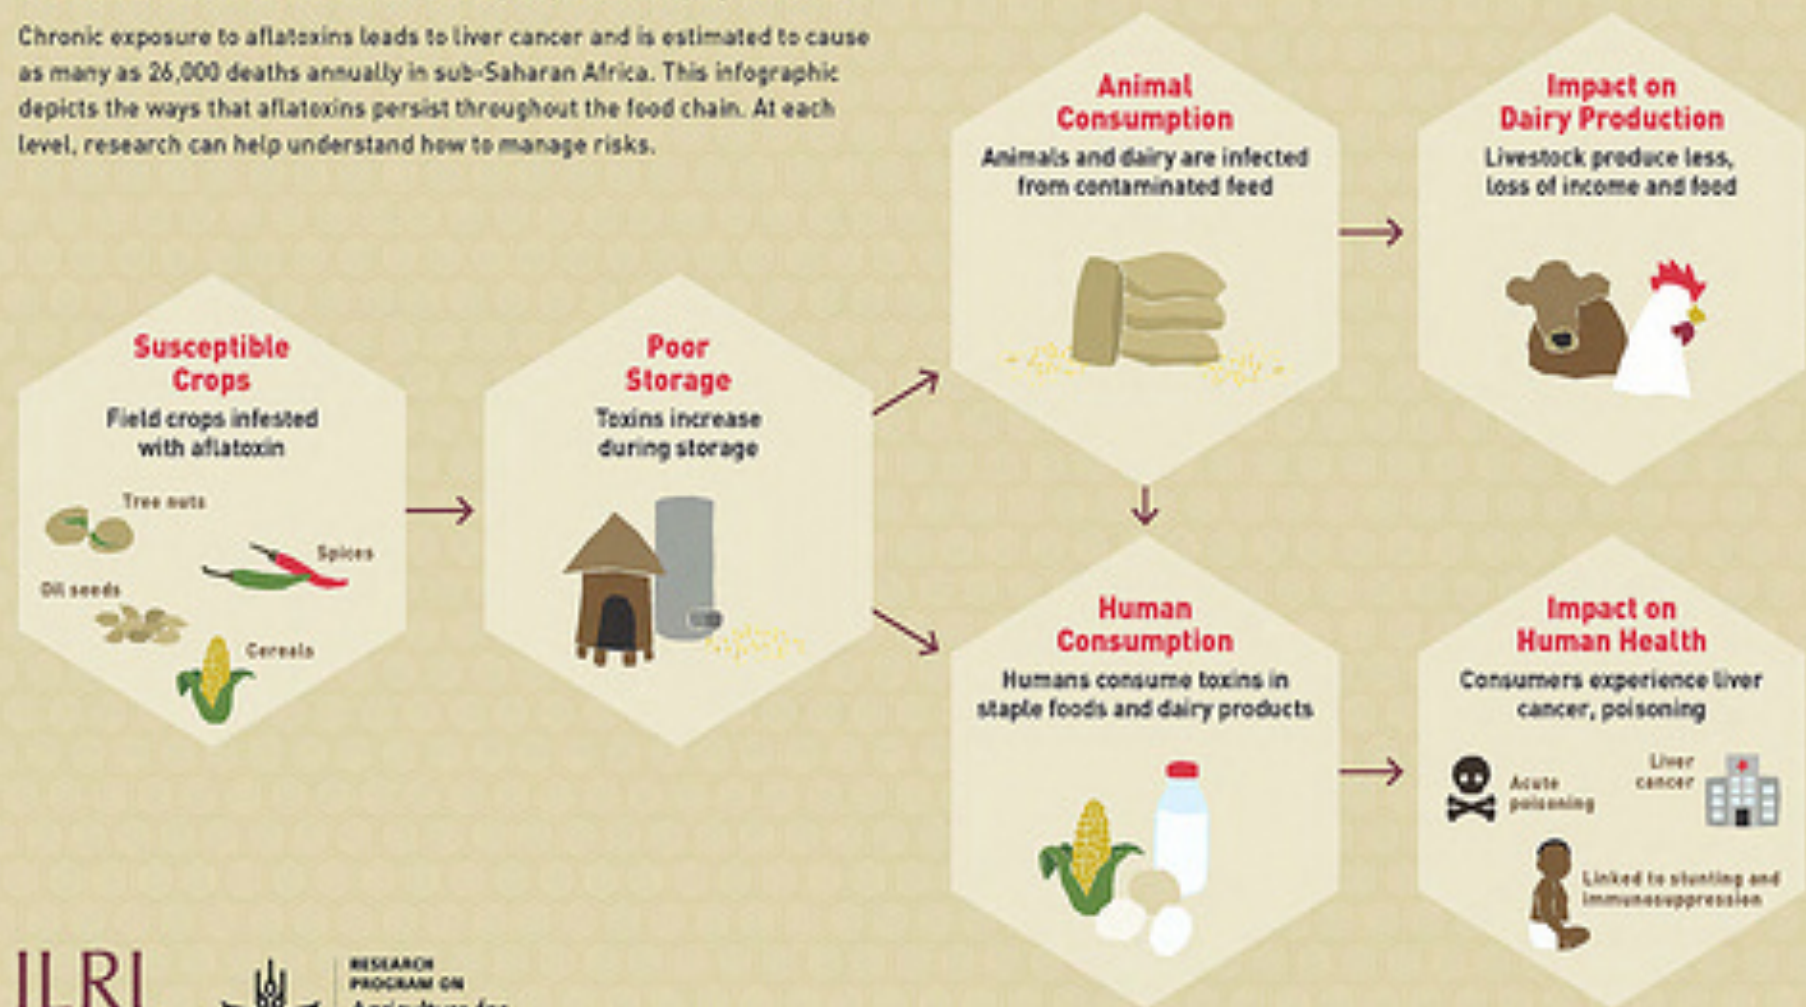

AFLATOXIN

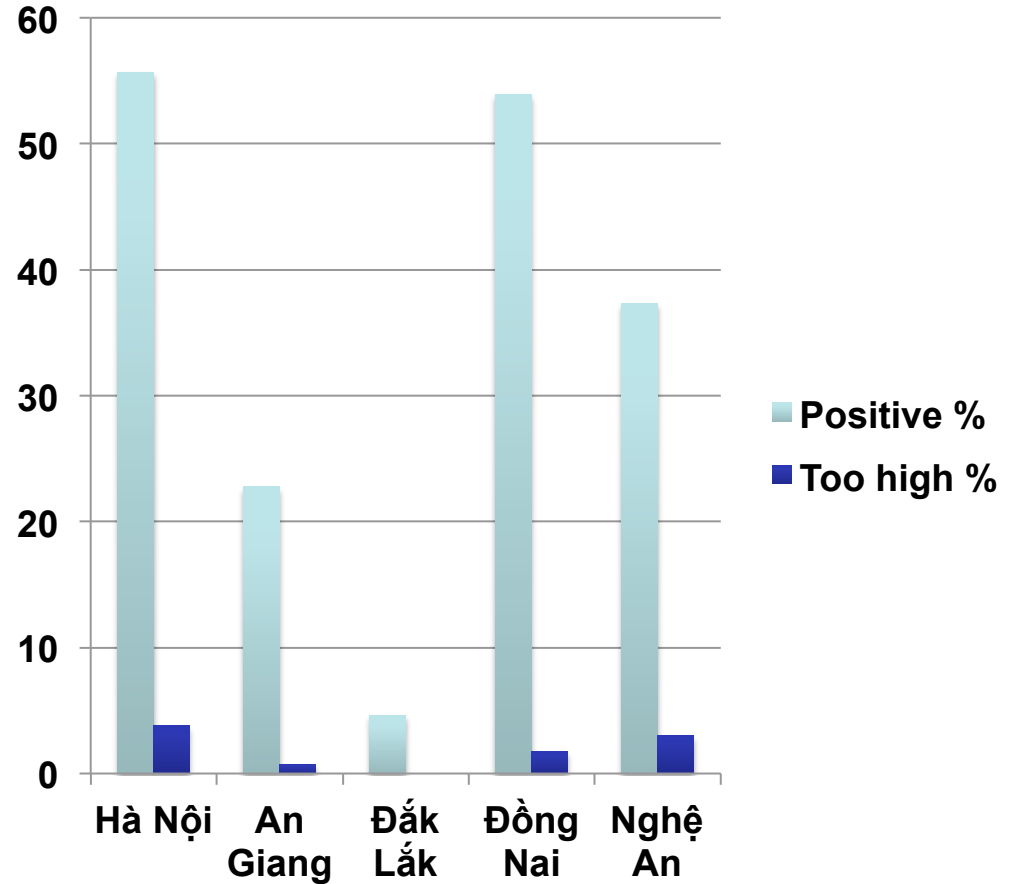

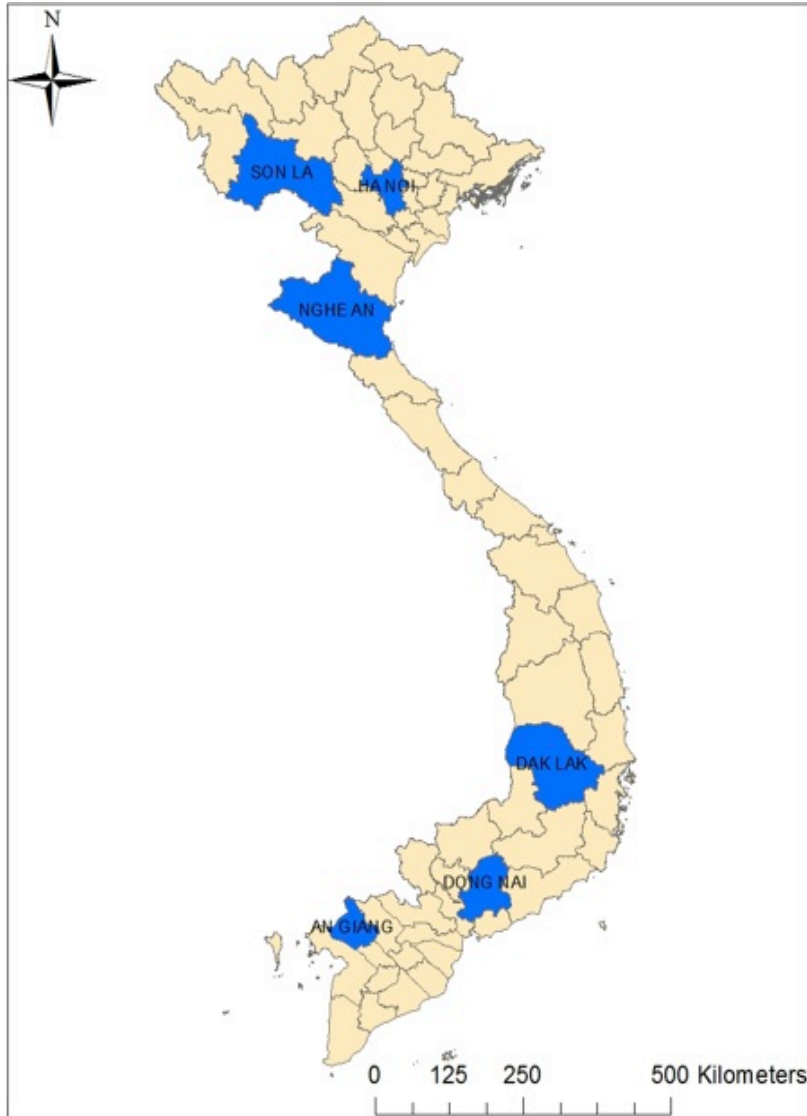

A Fungal Toxin Infecting the Food Chain

Persistent high levels of aflatoxins—naturally occurring carcinogenic byproducts of common fungi on grains and other crops—pose significant health risks to animals and humans in many tropical developing countries.

Chronic exposure to aflatoxins leads to liver cancer and is estimated to cause as many as 26,000 deaths annually in sub-Saharan Africa. This infographic depicts the ways that aflatoxins persist throughout the food chain. At each level, research can help understand how to manage risks.

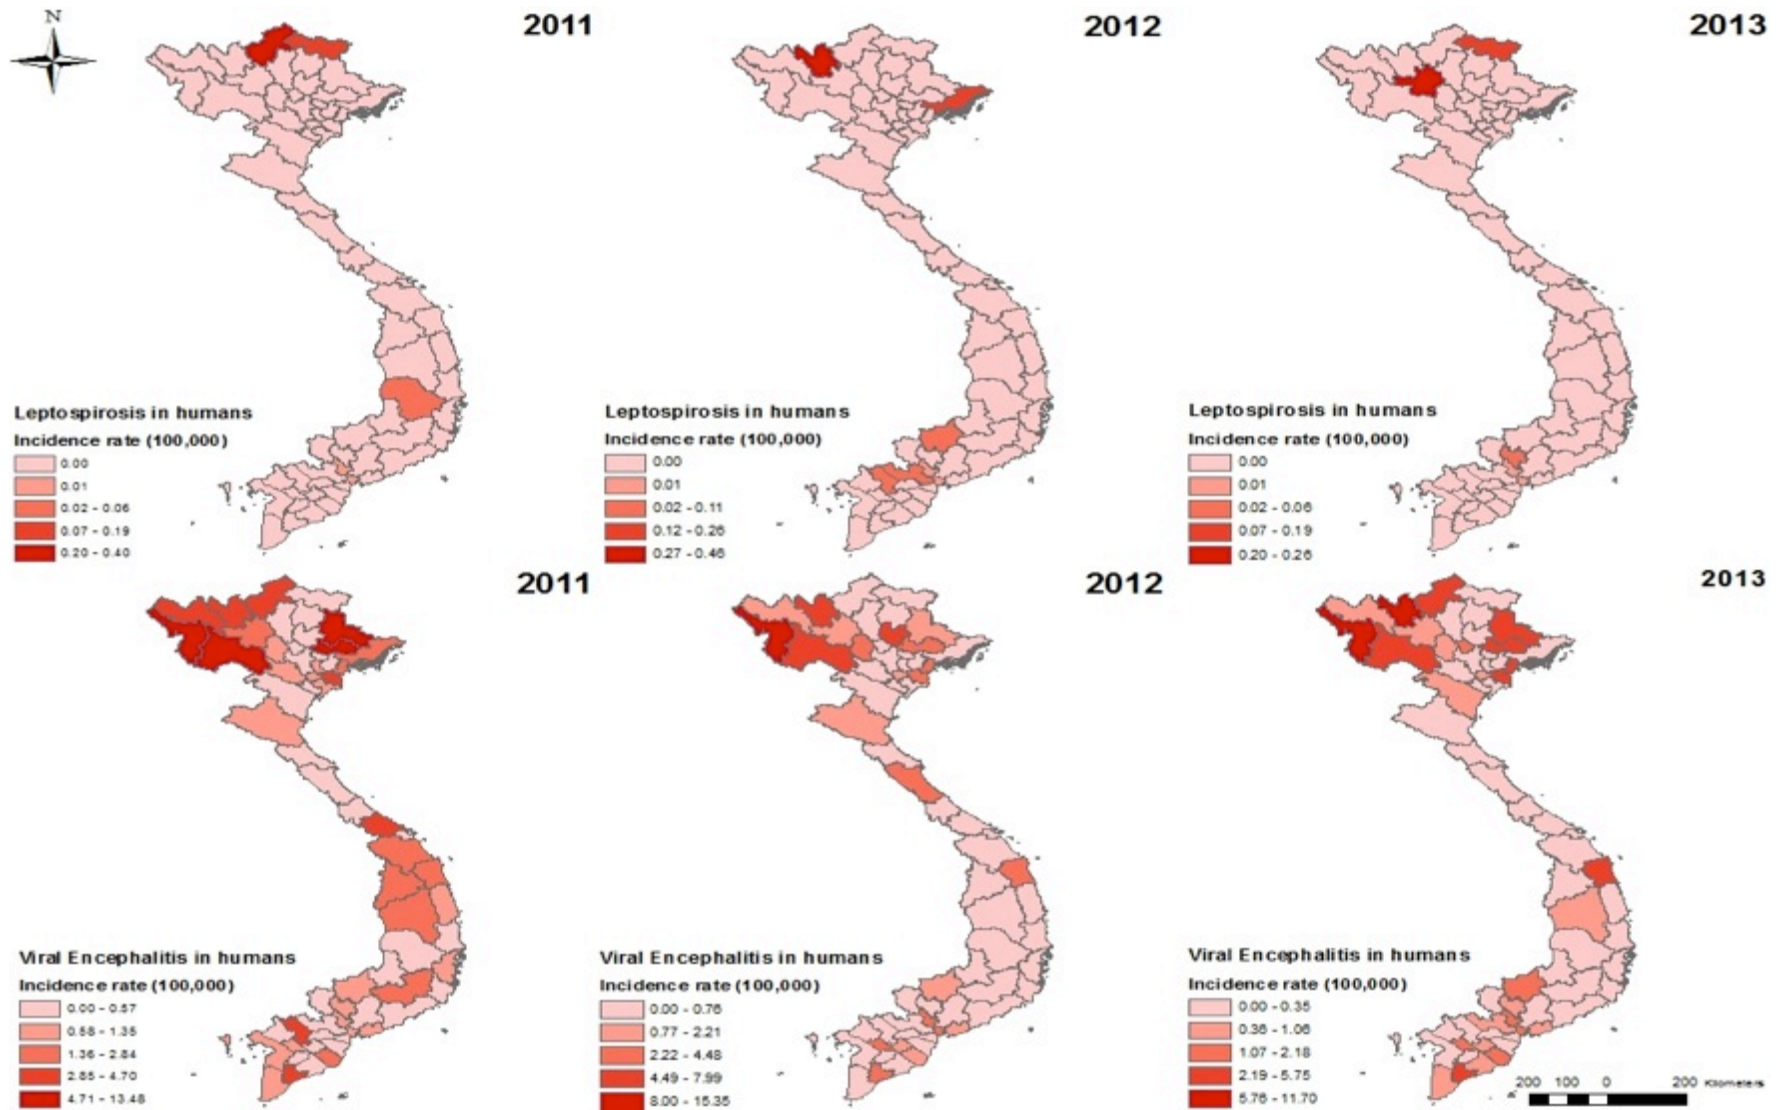

Aflatoxins in maize (n= 2,370)

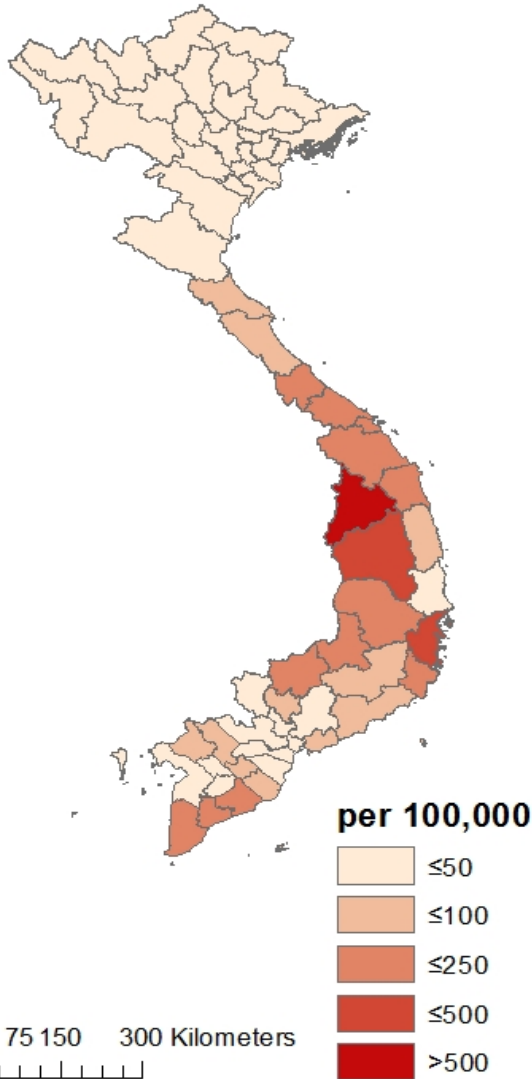

Annual incidence rates for lepto and VE in humans

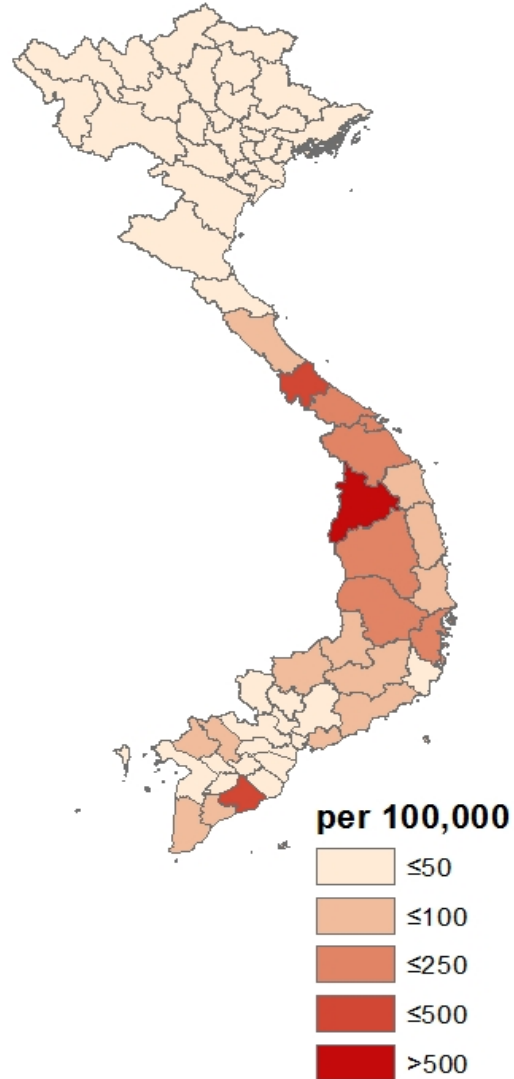

*Previous study showed that 60~71% of VE were caused by JE in Vietnam

Bacillary Dysentery 1999-2003

Bacillary Dysentery 2004-2008

Bacillary Dysentery 2009-2013

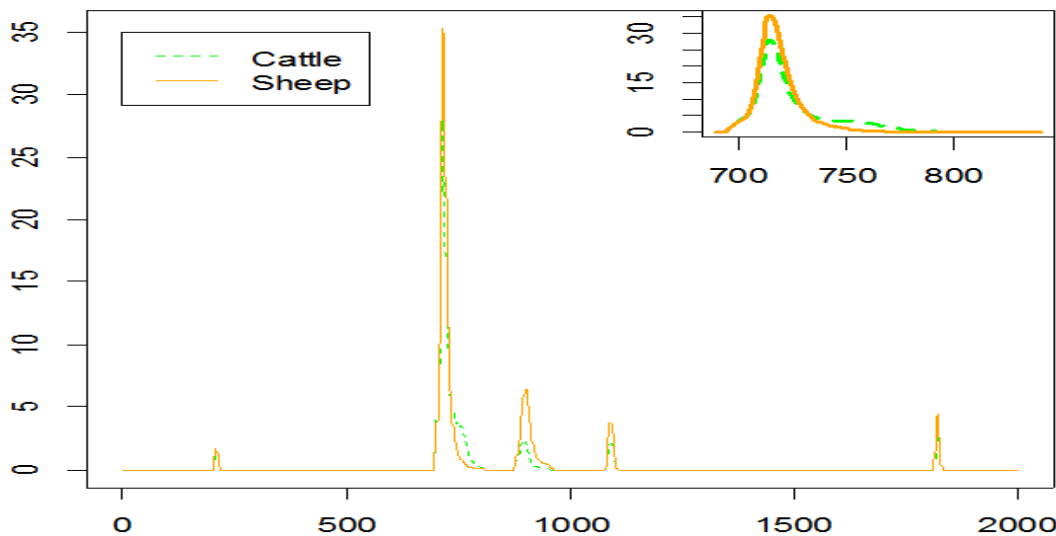

Vector population dynamics model

RVF outbreaks follow periods of excessive rains (TRMM precipitation data from NASA)

Disease transmission dynamics

Interaction between environmental factors, immunity in the disease occurrence and impacts

Anticipated outcome story/stories

Concept of climate and weather-sensitive disease explored and promoted

Researchers and policy makers will have evidence on spatial hotspots for climatic sensitive zoonoses and temporal risk patterns in order to better target surveillance and response

Better understanding of the relative importance of risk factors for diseases and pests in different contexts

One health weather based pest forecasting piloted for rubber, aflatoxins and weather sensitive disease

A photograph of four young girls sitting together in a rustic setting. They are wearing colorful, patterned traditional Indian clothing. The girl on the far left is wearing a green dress with gold patterns. The girl next to her is wearing a yellow dress with purple patterns. The girl in the center is wearing a green and yellow patterned dress with a green headscarf. The girl on the far right is wearing a blue and purple patterned dress. The background is a simple, textured wall. The text 'a4nh.cgiar.org' is overlaid in white in the center of the image.
